NAPSR – PHMSA Public Workshop on DIMP Implementation

**National Association of Pipeline Safety Representatives
Office of Pipeline Safety**

Massoud Tahamtani, Virginia

Topic Areas

- Expectations of DIMP
- Observations of noteworthy practices

Expectations of DIMP

- Procedural documentation describing tasks to be performed as required in §192.1007.
- Procedure means a fixed, step-by-step sequence of activities or course of action (with definite start and end points) that must be followed in the same order to correctly perform a task.
- A DIMP must be customized to the specific operator, and generic plans, procedures, and statements are not adequate.
- A DIMP must be continually improved based on feedback mechanisms within the program.

Expectations of DIMP (continued)

- Allocation of appropriate resources to perform the required DIMP Tasks.
- Use of technology (GIS, GPS, Bar coding, RFID, etc.) to help manage DIMP.

The benefit derived from a IM Program is proportional to the amount of effort and resources an operator puts into it.

Noteworthy Practices

- Excavation damage risk mitigation measures implemented:
 - Have complete buy-in from all employees
 - Have corporate damage prevention goals
 - Conduct pre-construction meetings
 - Enhance awareness education for top offenders
 - Have permanent markings in the high activity areas
 - Enhance locating by use of better technologies
 - Have QA/QC for locators
 - Improve quality of as-builts

DIMP Team is working on a compendium of implemented risk mitigation factors based on specific threats

Damages per 1,000 Excavation Tickets

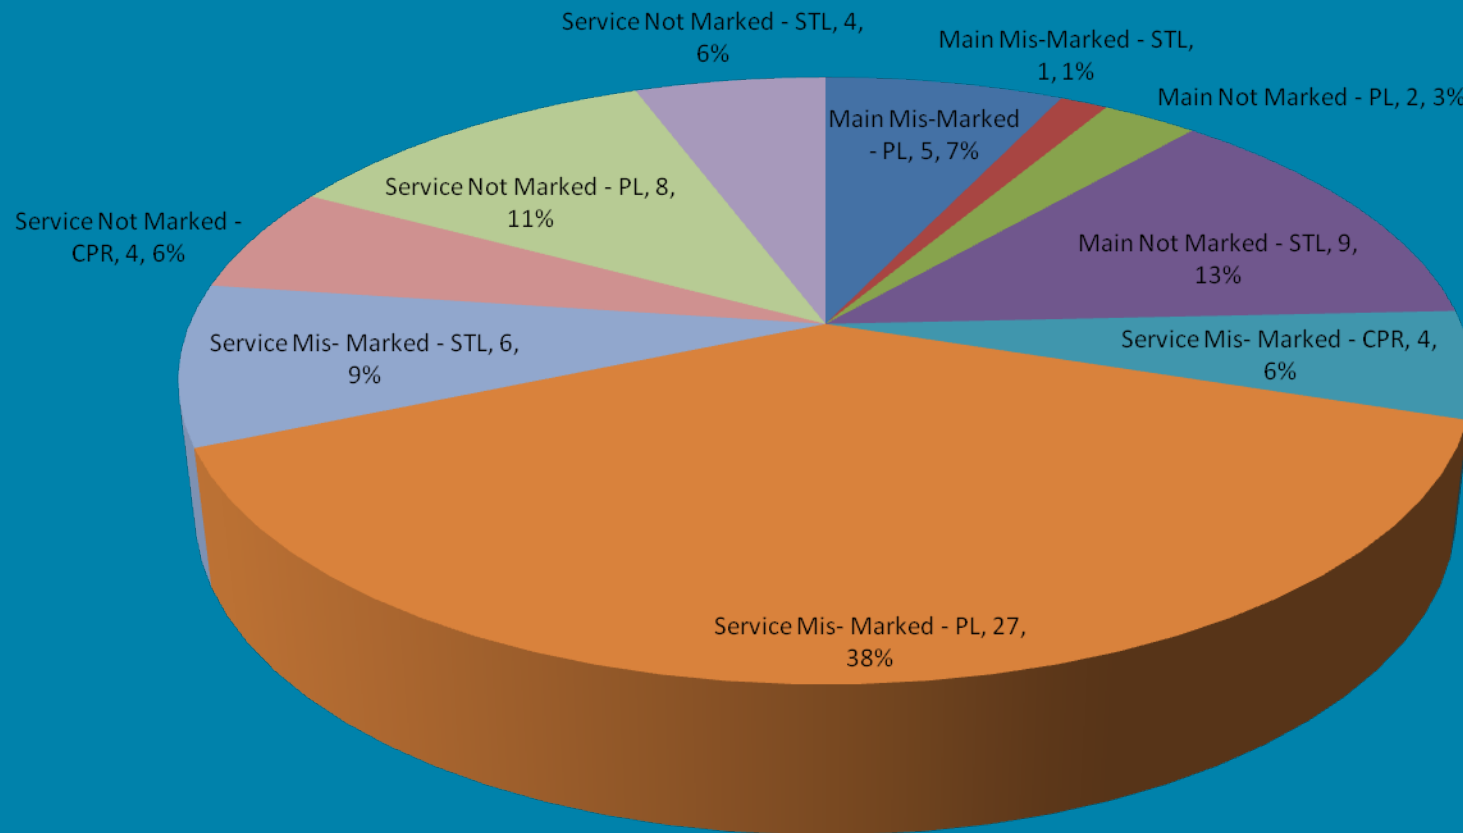

Company A State

Company A: Damage Cause Code Distribution

Company A: Contract Locating Issues (70 Damages)

2010 – 2011 Company A: Damages by Excavation Type Comparison

2010 – 2011 Company A: Damages Occurred While Excavator was Working For:

Risk-Based Inspection of Active Tickets

Elements of a Comprehensive Damage Prevention Program

- Enhanced communication between operators and excavators
- Fostering support and partnership of all stakeholders in all phases (enforcement, public education, etc.) of the program
- Operator's use of performance measures regarding persons performing location and pipeline construction
- Partnership in employee training
- Partnership in public education
- Enforcement agency's role as a partner and facilitator to help resolve issues
- Fair and consistent enforcement of the law to all stakeholders
- Use of technology to improve all parts of the process
- Analysis of data to continually evaluate/improve program effectiveness

Risk-Based Inspection of Active Tickets

Objectives:

- Conduct risk based inspections
- Leverage technology to gain efficiency in inspections
- Share risk areas with regional stakeholders to advance damage prevention

General Overview:

The Risk Assessment Model is a dynamic statistical analysis of Notification Center (“Miss Utility”) data and Miss Utility Statistical Tracking (“MUST”) data to determine risks associated with each notice of proposed excavation

Miss Utility ticket data is imported on a daily basis into our SQL Server where automated scripts assign potential risk to each ticket

The model utilizes ArcGIS to build raster assessment layers and plot Miss Utility ticket coordinates on the map using the center of the notification polygon

Risk assessment is based on three primary layers of risk:

- Utility Density in the excavation area
- Historical Performance of Utility, Excavator, and Locator
- Excavation or Demolition Work Type (such as directional boring)

Risk Assessment: Scale Value

- Each layer has a potential scale value which translates to point designation
- Layers are weighted and joined for a total possible scale value of 1000 points
- The higher the scale value the higher the risk

Flags Hyperlink Directly to Ticket Archives for Additional Information

The screenshot shows a web browser window with the address bar containing "Miss Utility of Virginia". The page title is "Ticket Archives". The search interface includes a "Year..." dropdown set to "2010" with a link "For 1997-2004", a "Search Method..." dropdown set to "TicketNumber", and a "Search Criteria..." input field containing "B018200622". A "Search" button is visible below the input field. The search results display the following information:
