## Liquid Pipeline Leak Detection: Challenges to R&D

Shane Siebenaler Group Leader, Fluid Dynamics Southwest Research Institute San Antonio, Texas

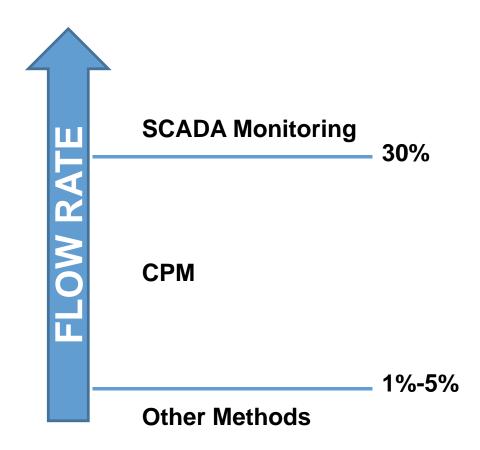

### **Types of Leak Detection**

- Flyovers
- SCADA monitoring
- Computational pipeline monitoring (CPM)
- External
  - Distributed sensing (e.g. temperature or acoustic)
  - Dielectric cables
  - Vapor tubes
  - Acoustic emissions
  - Vegetation monitoring

Note: many pipelines employ complimentary systems

### Leak Detection Application

### Sample Performance Parameters

- Leak location
- Non-leak alarm rate
- Smallest detectable leak
- Response time
- Length of coverage
- Adaptability to different conditions
- Availability (e.g. 24/7 coverage)
- Ability to retrofit
- Lifespan

### **Research Areas**

- Improvements in existing systems
  - Evaluation of performance
  - Non-leak alarm discrimination
  - Ease of implementation
- Physics of leaks
  - Hydraulic response
  - Discharged fluid propagation
  - Dynamic pressure within pipeline
- Driving down leak thresholds
  - CPM tuning
  - Novel technologies

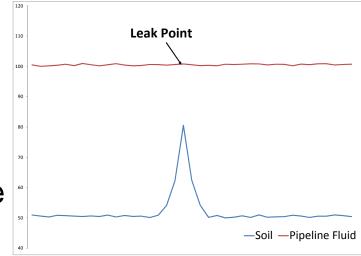

### Challenges to R&D and Testing

Perception	<ul> <li>No silver bullet technology</li> <li>Not all leaks carry same detection challenges</li> <li>Perception that any employed technology must find all leaks</li> </ul>
Testing Approaches	<ul> <li>No one-size-fits-all test set up</li> <li>Many systems must be tuned to each pipeline segment</li> <li>Leak simulation may include actual fluid discharge</li> </ul>
Markets	<ul> <li>Uncertainty in market stability</li> <li>Small technology firms may not have resources for expansive testing</li> </ul>
Benchmarks	<ul> <li>No standardization in requirements for research or testing</li> <li>Mismatch between desired and available data</li> </ul>

# Example: Distributed Temperature Sensing

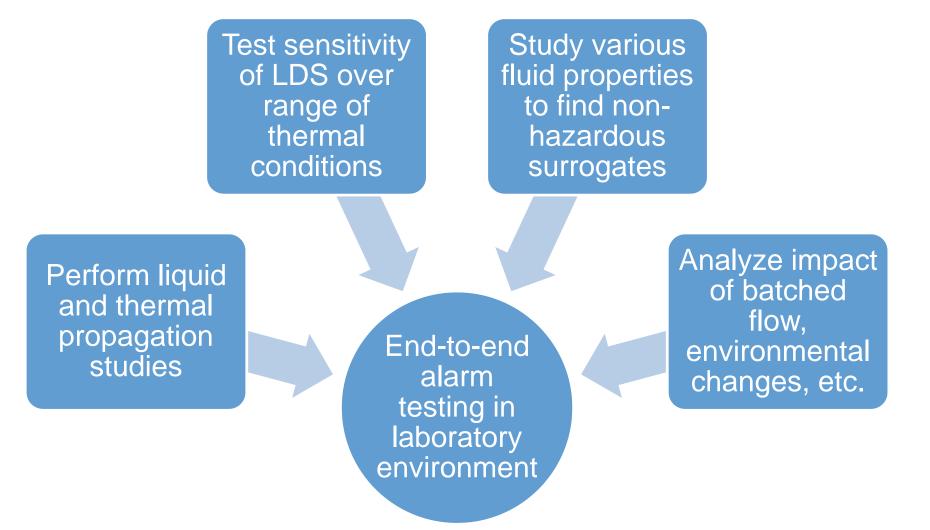

- Distributed temperature sensing utilizes a fiber-optic cable as a continuous (spatial and temporal) temperature transmitter
- Can detect leaks by monitoring localized temperature change (if pipeline fluid discharge temperature is different from soil)
- Not impacted by transient operations (e.g. shut-in, pump start)

### The Challenge

- How to test whether or not system can detect small leaks?
- Some challenges:
  - Discharge of actual fluid
  - Non-usability of test bed for subsequent runs
  - Testing long lengths (10's of miles)
  - Unknown drivers of leaks
  - Varying unit configurations

#### Solution – Separate Independent Tasks

### Addressing Challenges

Discharge of actual fluid	Find surrogate fluids (e.g. match viscosity)	
Re-use of test bed	Determine displaced volume for optimization	
Long lengths	Bare fiber spools for optical loss	
Unknown drivers	Comprehensive review of technical drivers	
Unit configurations	Laboratory runs for high permutation count	

### Leak Detection Gaps

Perception of Performance	<ul> <li>Education of public and of pipeline community</li> <li>Development of performance and selection guidelines</li> </ul>
Absence of Data on Leaks	<ul> <li>Sharing of non-proprietary information to help determine needs</li> <li>Evaluation of types of leaks (corrosion pin hole, crack, third-party damage, etc.)</li> </ul>
Gaps in Standards	<ul> <li>Development of performance guidelines for non-CPM systems</li> <li>Development of instrument selection guidelines</li> <li>Development of guidelines for common alarm interfaces</li> </ul>
Market Stability	<ul> <li>Joint-industry collaboration</li> <li>Develop benchmarks</li> <li>Sharing of testing results</li> </ul>

## Thank you.
